Federal Security Technologies

TSA: TF Green

The Situation;

Renovation done for TSA to enlarge their space, the build out was completed by Marron Construction out of Providence, RI. Federal Security Technologies were brought in with a communications company Bartone Communications, Bartone handled electronic security system, video surveillance (Bosche). Bartone also handled the Bosche intrusion detection system.

The responsibilities for FST were the card access control and updating credentials, we also installed the electrified lock hardware.

Challenges and Solutions;

In beginning there were issues with distances, because of how big TF green was. The solution for that was two separate gateway type controllers on each side of the facility. 14/15 doors, larger scope of work. Eight were on north side, remaining were on south side, deployed two individual controllers. They were at PIV 4 cards, we achieved PIV 5 cards for the employees.

Products used by FST;

1006 series to 9600 series HES lock hardware

Hirsch IDENTIV Model MX-8 controller

Hirsch's ScramblePad

Identiv's Hirsch Velocity software
