

Schlage NDE Networked Wireless Locks Works with Allegion's ENGAGE App

Organizations are making the switch to the more advanced electronic access control systems as opposed to the more traditional turn key locks. Many have implemented fully wired systems throughout their buildings. These locks are hardwired into a door frame and connected to both a reader and controller which communicate back to the access control system.

The NDE design packages the cylindrical lock, credential reader, and access control sensors together in to a small footprint that is both easy to install and affordable. It also fits into existing network architecture and can work in the same EAC system as other wireless locks including Schlage Control™, AD-400 and LE. Use the ENGAGE™ Gateway for real-time connectivity and lockdown

Implementing completely wireless locks into organizations, not only saves time but also money. NDE Networked Wireless Locks eliminate the need for wiring and can function as is since the wireless lock is able to talk directly to the access control system through the gateway. They can be managed from both web and mobile applications with access gained based on proximity and smart credentials, allowing for a much higher level of security.
